DF70: when the rotation speed exceeding the upper limitation, this bit is set to high (1).
 DF72: Counting Error (CE), mostly caused by magnetic error.
 DF70~DF77: LSB first.

11. Appendix: The Installation

KEM encoder is usually using hollow shaft to allow motor shaft directly inserting into the hollow, it shall be mounted by a flexible mounting plate as shown in figure above. Make sure to fix the shaft in that the mounting plate will not cause burden the ball bearing to the encoder and will not cause damage to the mounting plate.

Encoders are usually installed at the rear end of motor, shown as below pictures. The 8mm dia. motor shaft is standard and 6mm is optional. Insert the motor rear shaft into encoder's hollow shaft for about 12mm depth, tighten the encoder's flexible mounting bracket firmly onto motor rear end by two M3 screws.

Couple the encoder hollow shaft with the rigid motor shaft and always fasten attached screws securely. Be sure to firmly tighten two hex-screws that located at encoder's hollow shaft, apply threads-lock glue and tightly screwed in for long-term use.
